## Backend

mongoDB

## Artificial Intelligence

LangChain

Pinecone

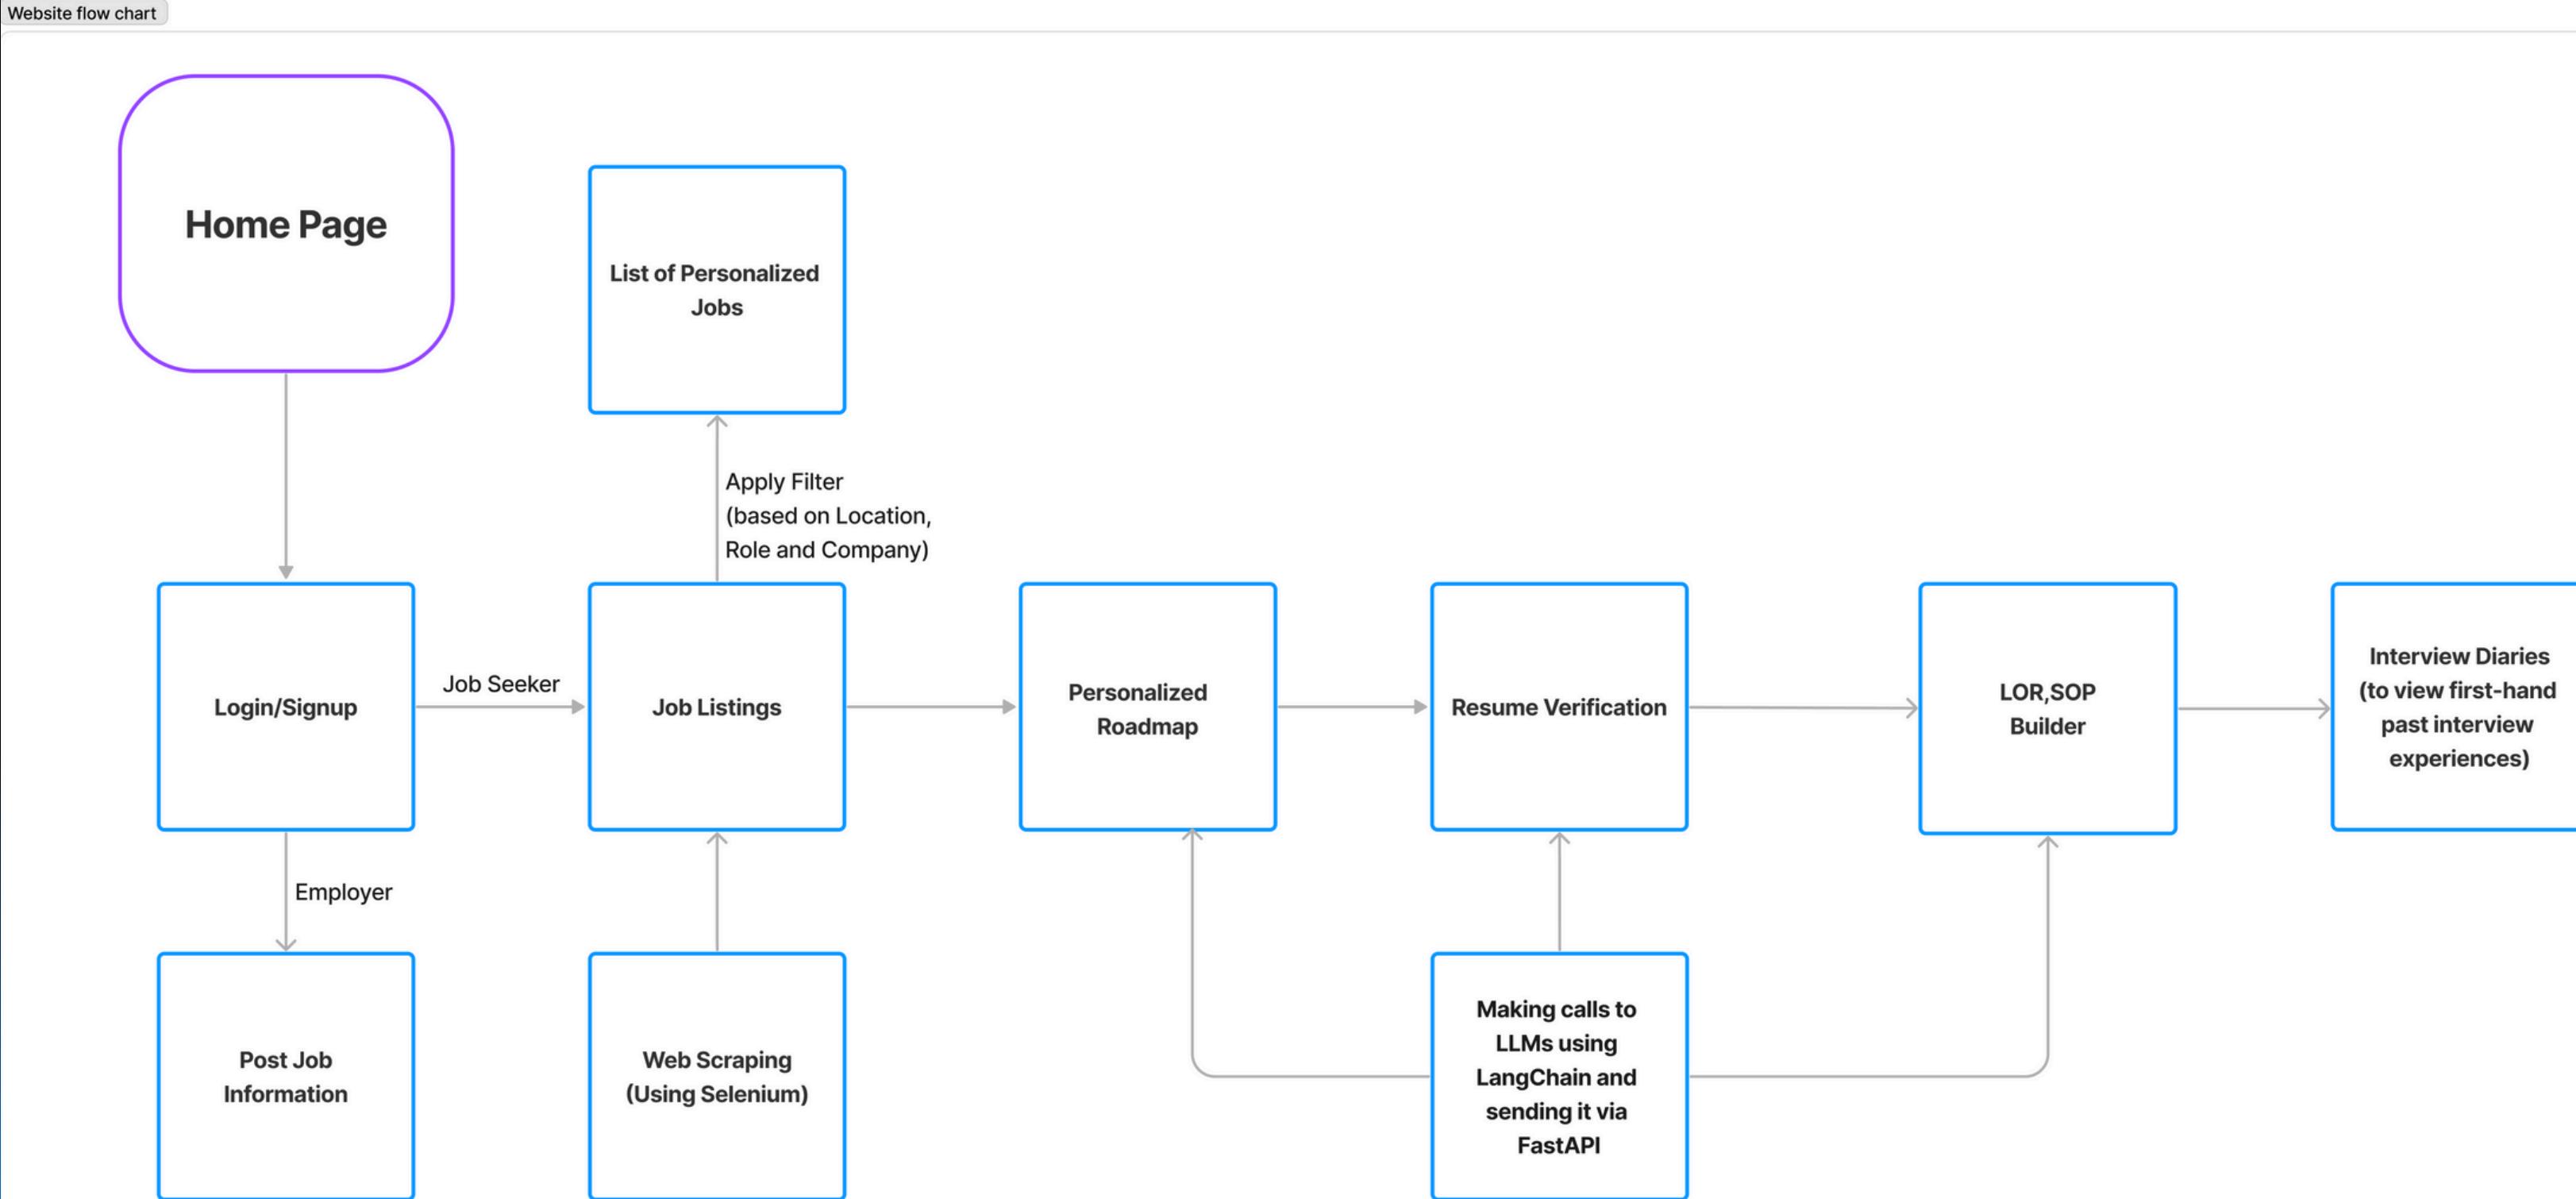

Selenium

# Tech Stack

# Workflow

# How is our solution sustainable?

- Searching for jobs every 24-hrs while deployment via CI/CD pipeline ensures that the latest jobs are available to the candidates and they don't need to manually search for them.
- AI-generated roadmap using **RAG(retrieval-augmented generation)** ensures the LLM doesn't hallucinate and the candidate doesn't waste time in planning and scheduling a learning plan.
- By providing comprehensive resources for securing a job without excessive scrolling, the platform ensures convenience for users. This **reduces the need to visit multiple websites, saving time and effort.**
- **We use the latest industry frameworks like LangChain, Selenium, React.JS, Node.JS and we plan to deploy it using Docker containers as per industry standards.**

# Future Prospects

## Integration Opportunities

- Expand capabilities through strategic integrations with college placement cells and companies to improve job matching and recruitment processes.

## Mobile Engagement

- Develop a mobile application featuring push notifications for immediate updates, enhancing engagement and real-time interaction between companies and job seekers.

## Enhanced Interview Process

- Implement advanced tools and features like virtual interview spaces to streamline the interview process, providing a seamless experience for both companies and applicants.

# THANK YOU
